Magnetars: SGRs and AXPs

Magnetic field distribution

Fields from P-Pdot using magneto-dipole formula

1805.01680 (taken from Olausen, Kaspi 2014)

Magnetars in the Galaxy

- ~24 SGRs and AXPs, plus 6 candidates, plus radio pulsars with high magnetic fields (about them see arXiv: 1010.4592)...
- Young objects (about 10³⁻⁵ year).

Catalogue: http://www.physics.mcgill.ca/~pulsar/magnetar/main.html

(see a recent review in arXiv:1503.06313 and the catalogue description in 1309.4167)

Birth rate of magnetars

Fraction of magnetars among NSs is uncertain.

Typically, the value ~10% is quoted (e.g. 0910.2190). This is supported observationally and theoretically.

Recent modeling favours somehow larger values: 1903.06718. However, the result is model dependent. In particular, it depends on the model of field decay.

Several of magnetars are related to SNRs.

Many of magnetars show glitches.

Spatial distribution

Scale height ~20 pc

Soft Gamma Repeaters: main properties

- Energetic "Giant Flares" (GFs, L ≈ 10⁴⁵-10⁴⁷ erg/s) detected from 3 (4?) sources
- No evidence for a binary companion, association with a SNR at least in one case
- Persistent X-ray emitters, L ≈ 10³⁵ - 10³⁶ erg/s
- Pulsations discovered both in GFs tails and persistent emission, P ≈ 5 -10 s
- Huge spindown rates,
 P/P ≈ 10⁻¹⁰ s⁻¹

Saturation

- Events in the LMC. SGR 0520-66.
- Fluence: about 10⁻³ erg/cm²

Mazets et al. 1979

N49 – supernova remnant in the Large Magellanic cloud (e.g. G. Vedrenne et al. 1979)

Main types of activity of SGRs

- Weak bursts. L<10⁴² erg/s
- Intermediate. L~10⁴²–10⁴³ erg/s
- Giant. L<10⁴⁵ erg/s
- Hyperflares. L>10⁴⁶ erg/s

Power distribution is similar to the distribution of earthquakes in magnitude

See the review in Rea, Esposito 1101.4472

Normal bursts of SGRs and AXPs

 Typical weak bursts of SGR 1806-29,
 SGR 1900+14 and of
 AXP 1E 2259+586
 detected by RXTE

(from Woods, Thompson 2004)

Intermediate SGR bursts

Examples of intermediate bursts.

The forth (bottom right) is sometimes defined as a giant burst (for example by Mazets et al.).

(from Woods, Thompson 2004)

Giant flare of the SGR 1900+14 (27 August 1998)

- Ulysses observations (figure from Hurley et al.)
- Initial spike 0.35 s
- P=5.16 s
- L>3 10⁴⁴ erg/s
- E_{TOTAL}>10⁴⁴ erg

Hurley et al. 1999

Anomalous X-ray pulsars

Identified as a separate group in 1995. (Mereghetti, Stella 1995 Van Paradijs et al.1995)

- Similar periods (5-10 sec)
- Constant spin down
- Absence of optical companions
- Relatively weak luminosity
- Constant luminosity

Anomalous X-ray Pulsars: main properties

Twelve sources known:

- 1E 1048.1-5937, 1E 2259+586, 4U 0142+614,
- 1 RXS J170849-4009, 1E 1841-045,
- CXOU 010043-721134, AX J1845-0258,
- CXOU J164710-455216, XTE J1810-197,
- 1E 1547.0-5408, PSR J1622-4950, CXOU J171405.7-381031
- Persistent X-ray emitters, $L \approx 10^{34} 10^{35}$ erg/s
- Pulsations with $P \approx 2 10 \text{ s} (0.33 \text{ sec for PSR } 1846)$
- Large spindown rates, P/P ≈ 10⁻¹¹ s⁻¹
- No evidence for a binary companion, association with a SNR in several cases

Are SGRs and AXPs brothers?

- Bursts of AXPs (more than half burst)
- Spectral properties
- Quiescent periods of SGRs (0525-66 since 1983)

Gavriil et al. 2002

Bursts of the AXP 1E1547.0-5408

Bursts of the AXP 1E1547.0-5408

Some bursts have pulsating tails with spin period.

Unique AXP bursts?

Bursts from AXP J1810-197. Note a long exponential tail with pulsations.

(Woods et al. 2005 astro-ph/ astro-ph/0505039)

A Tale of Two Populations ?

Pulse profiles of SGRs and AXPs

Hard X-ray Emission

INTEGRAL revealed substantial emission in the 20 -100 keV band from SGRs and APXs

Hard power law tails with Γ ≈ 1-3 (see 1712.09643 about spectral modeling)

Hard emission pulse

SGRs and AXPs

SGRs and AXPs soft X-ray Spectra 0.5 – 10 keV emission is well represented by a blackbody plus a power law

See also discussions in: arXiv: 1001.3847, 1009.2810

SGRs and AXPs soft X-ray Spectra

- kT_{BB} ~ 0.5 keV, does not change much in different sources
- Photon index $\Gamma \approx 1 4$,
 - AXPs tend to be softer
- SGRs and AXPs persistent emission is variable (months/years)
- Variability is mostly associated with the non-thermal component

Magnetar spectra in comparison

Hard tails can be due to upscattering of thermal photons from the surface in the magnetosphere.

And what about AXPs and PSRs?

1E1547.0-5408 – the most rapidly rotating AXP (2.1 sec) The highest rotation energy losses among SGRs and AXPs. Bursting activity.

Pulsar wind nebulae around an AXP.

0909.3843

See 1902.10712 about radio observations of magnetars.

Postburst properties of PSR J1846-0258

The pulsar showed a glitch. A period of magnetar-like activity was started. After the burst parameters of the pulsar changed.

n=2.65 -> n=2.16 Timing noise was increased (was very small for a magnetar before bursts)

Galactic center magnetar

SGR/PSR J1745-2900

<1 pc from Sgr A*

Radio pulsations detection in 2013 The largest dispersion measure and rotation measure among PSRs.

Generation of the magnetic field

The mechanism of the magnetic field generation is still unknown.

Turbulent dynamo

 α - Ω dynamo (Duncan, Thompson) α^2 dynamo (Bonanno et al.) or their combination

In any case, initial rotation of a protoNS is the critical parameter.

Strong field via flux conservation

There are reasons to suspect that the magnetic fields of magnetars are not due to any kind of dynamo mechanism, but just due to flux conservation:

- Study of SNRs with magnetars (Vink and Kuiper 2006, see also 1708.01626). If there was a rapidly rotating magnetar then a huge energy release is inevitable. No traces of such energy injections are found.
- 2. There are few examples of massive stars with field strong enough to produce a magnetars due to flux conservation (Ferrario and Wickramasinghe 2006)

Still, these suggestions can be criticized (Spruit arXiv: 0711.3650)

Alternative theory

- Remnant fallback disc
- Mereghetti, Stella 1995
- Van Paradijs et al.1995
- Alpar 2001
- Marsden et al. 2001
- Problems
- How to generate strong bursts?
- Discovery of a passive disc in one of AXPs (Wang et al. 2006).
 A new burst of interest to this model.
- Timing noise analysis contradicts accretion (1806.00401)

Magnetic field estimates

- Spin down
- Long spin periods
- Energy to support bursts
- Field to confine a fireball (tails)
- Duration of spikes (alfven waves)
- Direct measurements of magnetic field (cyclotron lines)

Spectral lines claims

All claims were done for RXTE observations (there are few other candidates). All detections were done during bursts.

1E 1048.1-5937 Gavriil et al. (2002, 2004) 4U 0142+61 Gavriil et al. (2007)

Hyperflare of SGR 1806-20

- 27 December 2004 A giant flare from SGR 1806-20 was detected by many satellites: Swift, RHESSI, Konus-Wind, Coronas-F, Integral, HEND, ...
- 100 times brighter than any other!

Palmer et al. astro-ph/0503030

Integral

RHESSI

27 Dec 2004: Giant flare of the SGR 1806-20

- Spike 0.2 s
- Fluence 1 erg/cm²
- E(spike)=3.5 10⁴⁶ erg
- L(spike)=1.8 10⁴⁷ erg/s
- Long «tail» (400 s)
- P=7.65 s

Konus observations

Mazets et al. 2005

The myth about Medusa

QPO in tails of giant flares of SGRs

A kind of quasi periodic oscillations have been found in tail of two events (aug. 1998, dec. 2004). They are supposed to be torsional oscillations of NSs, however, it is not clear, yet.

(Israel et al. 2005 astro-ph/0505255, Watts and Strohmayer 2005 astro-ph/0608463)

QPO in SGR 1806-20 giant flare

Power spectrum made by averaging nine 3 s segments from the time interval marked by dashed lines in the top left panel. The 92 Hz and 625 Hz QPOs are clearly visible, and the inset illustrates the significance of the 625 Hz feature (from Strohmayer & Watts, 2006)

See fresh analysis in 1808.09483

SGR 1806-20 - I

SGR 1806-20 displayed a gradual increase in the level of activity during 2003-2004 (Woods et al 2004; Mereghetti et al

SGR 1806-20 - II

Twisted Magnetospheres – I

- The magnetic field inside a "wound up"
- The presence of a toroidal induces a rotation of the sum
- The crust tensile strength i
- A gradual (quasi-plastic ?) crust
- The external field twists up (Thompson, Lyutikov & Kulkarni 2002)

Growing twist

(images from Mereghetti arXiv: 0804.0250)

A Growing Twist in SGR 1806-20?

- Evidence for spectral hardening AND enhanced spin-down
- F-Pdot and F-L correlations
- Growth of bursting activity
- Possible presence of proton cyclotron line only during bursts

All these features are consistent with an increasingly twisted magnetosphere

Twisted magnetospheres

- Twisted magnetosphere model, within magnetar scenario, in general agreement with observations
- Resonant scattering of thermal, surface photons produces spectra with right properties
- Many issues need to be investigated further
 - Twist of more general external fields
 - Detailed models for magnetospheric currents
 - More accurate treatment of cross section including QED effects and electron recoil
 - 10-100 keV tails: up-scattering by (ultra)relativistic (e[±]) particles ?
 - Create an archive to fit model spectra to observations

See, for example, arXiv: 1008.4388 and references therein and more recent studies in 1201.3635

Non-global twist model

Low-field magnetars

SGR 0418+5729 and Swift J1822.3-160

See a review in arXiv:1303.6052

The first low-field magnetar

Only after ~3 years of observations it was possible to detect spin-down.

The dipolar field is $\sim 6 \ 10^{12}$ G.

The dipolar field could decay, and activity is due to the toroidal field.

Large field (at last) ... But multipoles!

XMM-Newton observations allowed to detect a spectral line which is variable with phase. If the line is interpreted as a proton cyclotron line, then the field in the absorbing region is $2 \ 10^{14} - 10^{15}$ G

1308.4987

SGR 0418+5729

Another low-field magnetar

3XMM J185246.6+003317 P=11.5 s No spin-down detected after 7 months B<4 10¹³ G Transient magnetar

Muno et al. arXiv: 0711.0988

Extragalactic giant flares

Initial enthusiasm that most of short GRBs can be explained as giant flares of extraG SGRs disappeared.

At the moment, we have a definite deficit of extraG SGR bursts, especially in the direction of Virgo cluster (Popov, Stern 2006; Lazzatti et al. 2006).

However, there are several good candidates.

Extragalactic SGRs

It was suggested long ago (Mazets et al. 1982) that present-day detectors could alredy detect giant flares from extragalactic magnetars.

However, all searches in, for example, BATSE database did not provide clear candidates (Lazzati et al. 2006, Popov & Stern 2006, etc.).

Finally, recently several good candidates have been proposed by different groups (Mazets et al., Frederiks et al., Golenetskii et al., Ofek et al, Crider).

[D. Frederiks et al. astro-ph/0609544]

Magnetars and supernovae

With large field and short spin a newborn NS can contribute a lot to the luminosity of a SN.

KASEN & BILDSTEN (2010)

Parameters needed

For short initial spin periods it is not even necessary to have magnetar scale B.

Magnetars and GRBs

What is special about magnetars? Link with massive stars There are reasons to suspect that magnetars are connected to massive stars (astro-ph/0611589, but see 1708.01626).

Link to binary stars There is a hypothesis that magnetars are formed in close binary systems (astro-ph/0505406, 0905.3238). AX

The question is still on the list.

AXP in Westerlund 1 most probably has a very massive progenitor >40 Msolar.

Are there magnetars in binaries?

At the moment all known SGRs and AXPs are isolated objects. About 10% of NSs are expected to be in binaries. The fact that all known magnetars are isolated can be related to their origin, but this is unclear.

If a magnetar appears in a very close binary system, then an analogue of a *polar* can be formed.

The secondary star is inside the huge magnetosphere of a magnetar.

This can lead to interesting observational manifestations.

Magnetor

arXiv:0803.1373

Few candidates have been proposed based on long spin periods and large Pdots: 1203.1490, 1208.4487, 1210.7680, 1303.5507

Conclusions

- Two classes of magnetars: SGRs and AXPs
- Similar properties (but no giant flare in AXPs, yet?)
- Hyperflares (27 Dec 2004)
- Transient magnetars
- About 10% of newborn NSs
- Links to PSRs (and others?)
- Twisted magnetospheres
